Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a xhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the ECORI-KhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRI). This library was constructed in the laboratory of Dr. Randy Shoemaker."

Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI- XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DHIOB host cells (Gibco BRL). This library was constructed in the laboratory of Dr. Randy Shoemaker at Iowa state university."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a non allele-specific antisense nucleic acids, which binds to methyleneterrahydrofolate reductase (WHFR: EC 1.5.1.20) nucleic acids and inhibits WHFR protein expression in a mammal. WHFR catalyses the NADPH-linked reduction of 5,10-methylenetetrahydrofolate, a co-substrate for methylation of homocysteine to methionine. The invariate for methylation of individuals with WHFR deficiency. The non allele-specific antisense nucleic acids are useful for treating retaining or preventing cancer, particularly breast carcinoma, colon carcinoma, colorectal carcinoma, lung cancer, brain cancer, pancreatic cancer, kidney cell cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; methylenetetrahydrofolate reductase; MTHFR; gene therapy; glioma; antisense therapy; EC 1.5.1.20; chromosome 1p36.3; cancer; kidney cell; pancreas; lung; brain; cytostatic; colon carcinoma; breast; colorectal; neuroblastoma; leukaemia.
